Basic queries for the operating jupyter note and perform

esc +a } it will add a cell to the above to the current cell.

esc +b } to add the cell in the file (it will to bellow the cell)

esc +dd (to deleted)

esc + m as markdown cell to type the text

going to the code

type ("hello world")

type ("54")

esc +y

ctrl + enter execute the cell

shift + enter execute the cell and the moves to the next cell

type (2)

type(2.0)

type (True)

type (False)

type(false)

type(true)

operator as grammars

arithmetic operators

athematic operator: +,-.*,//,/,**,%,**

% as first reminder

how to executer the single cell 30 times?

place the cursor in side the cell ands press the ctrl for 30 times

how to validate the datatypes by using type function answer over the data type : example : type("56") out put as str

what is a function

a function is a pre-defined code which will take input and show you the output based on the code by the developer ex: type()

what are the operators present in side python

arithmetic

comparison

logical

bitwise

assignment

special operator

what is print function ?

it is use to showcase the input outside the cell

/n - it will give the next line

a print function will showcase the out put and sends the cursor to next line by nature , so
ex: print(2)

print(3)

ex 2 : here we are stoping the corssor form moving to nextline and making to give a space
syntax print(" " ,end = " ")

print(3 5)

ex 3 : how to devide 2 output by (,) -- print(3,end=",")

print(2)

output 3 ,2
